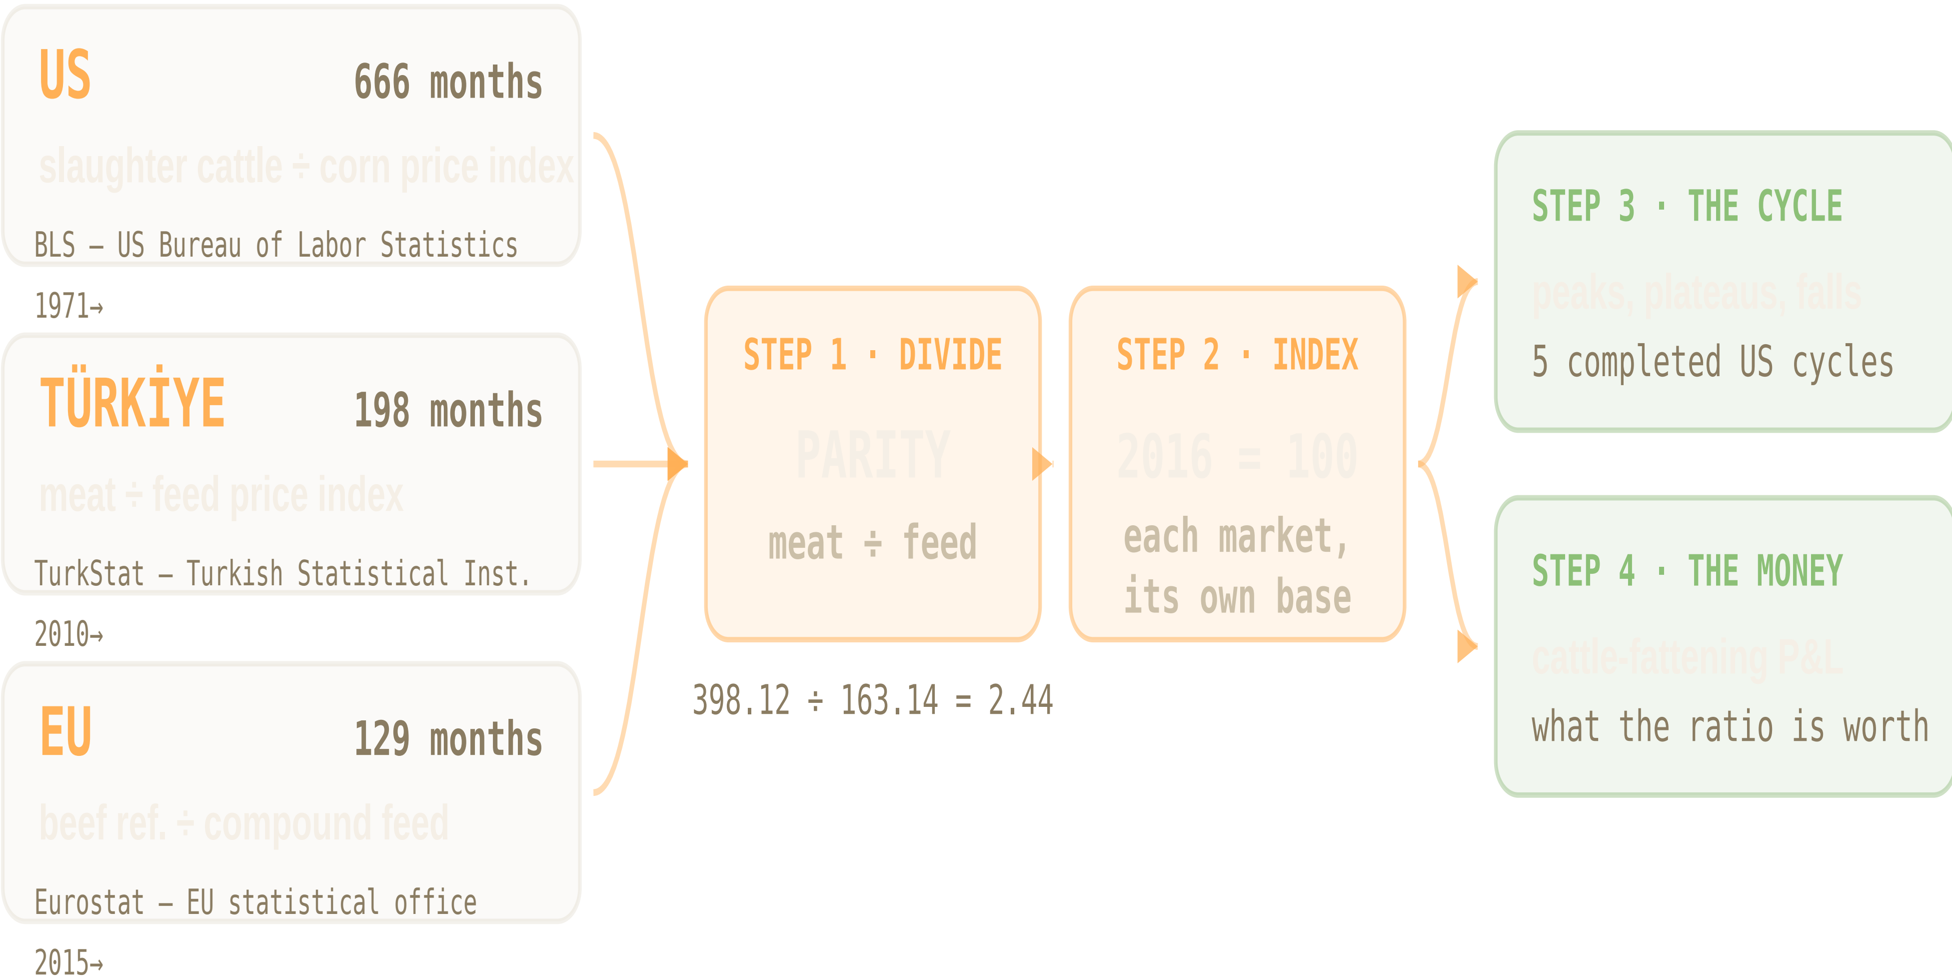
WHAT THIS STUDY IS · JULY 2026

55 years of US data. 16 of Türkiye. 11 of the EU.

Six published price series — every monthly observation each country has — consolidated into one comparable measure of what a livestock producer earns, then read for its cycle.



ALL PRICES AS PUBLISHED BY THE NATIONAL STATISTICS OFFICES · NOTHING ESTIMATED, NOTHING BACKFILLED · DATA THROUGH JUNE 2026

LIVESTOCK CUSTOMER ECONOMICS · US · EU · TÜRKİYE · JULY 2026

Cattle producers in all three of our markets are at a cycle peak.

+84% US **+25%** EU **+21%** TR

more feed a kilo of beef buys today than it did in 2016 — each market against its own past

13

months the US has already spent within 10% of its peak

0

of the five previous US peaks that lasted — every one fell back

MEAT PRICE ÷ FEED COST · SOURCES: BLS (US), EUROSTAT (EU), TURKSTAT (TÜRKİYE) · DATA THROUGH JUNE 2026

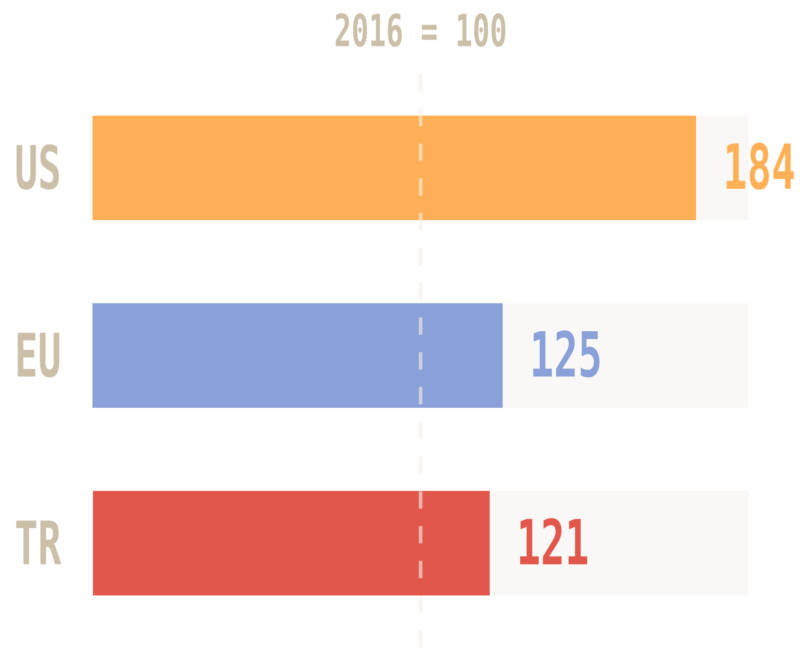
WHAT YOU ARE LOOKING AT

One ratio: what a kilo of beef is worth in feed.

Higher = meat outpacing feed, the producer earns more. It is a relative measure — read it against its own past, never as a quantity of feed.

FEED-BUYING POWER OF A KILO OF US BEEF

ALL THREE MARKETS · EACH VS ITS OWN 2016



US 184 = 84% more feed per kilo of beef than in 2016.

each oval = the Dec 1974 low · ratio of US cattle and corn producer price indexes

Levels differ by market — read the shape, not the gap.

US slaughter cattle ÷ corn
BLS (US federal statistics office) · 1971→ · 666 mo

EU beef ref. price ÷ compound feed
Eurostat · 2015→ · 129 mo

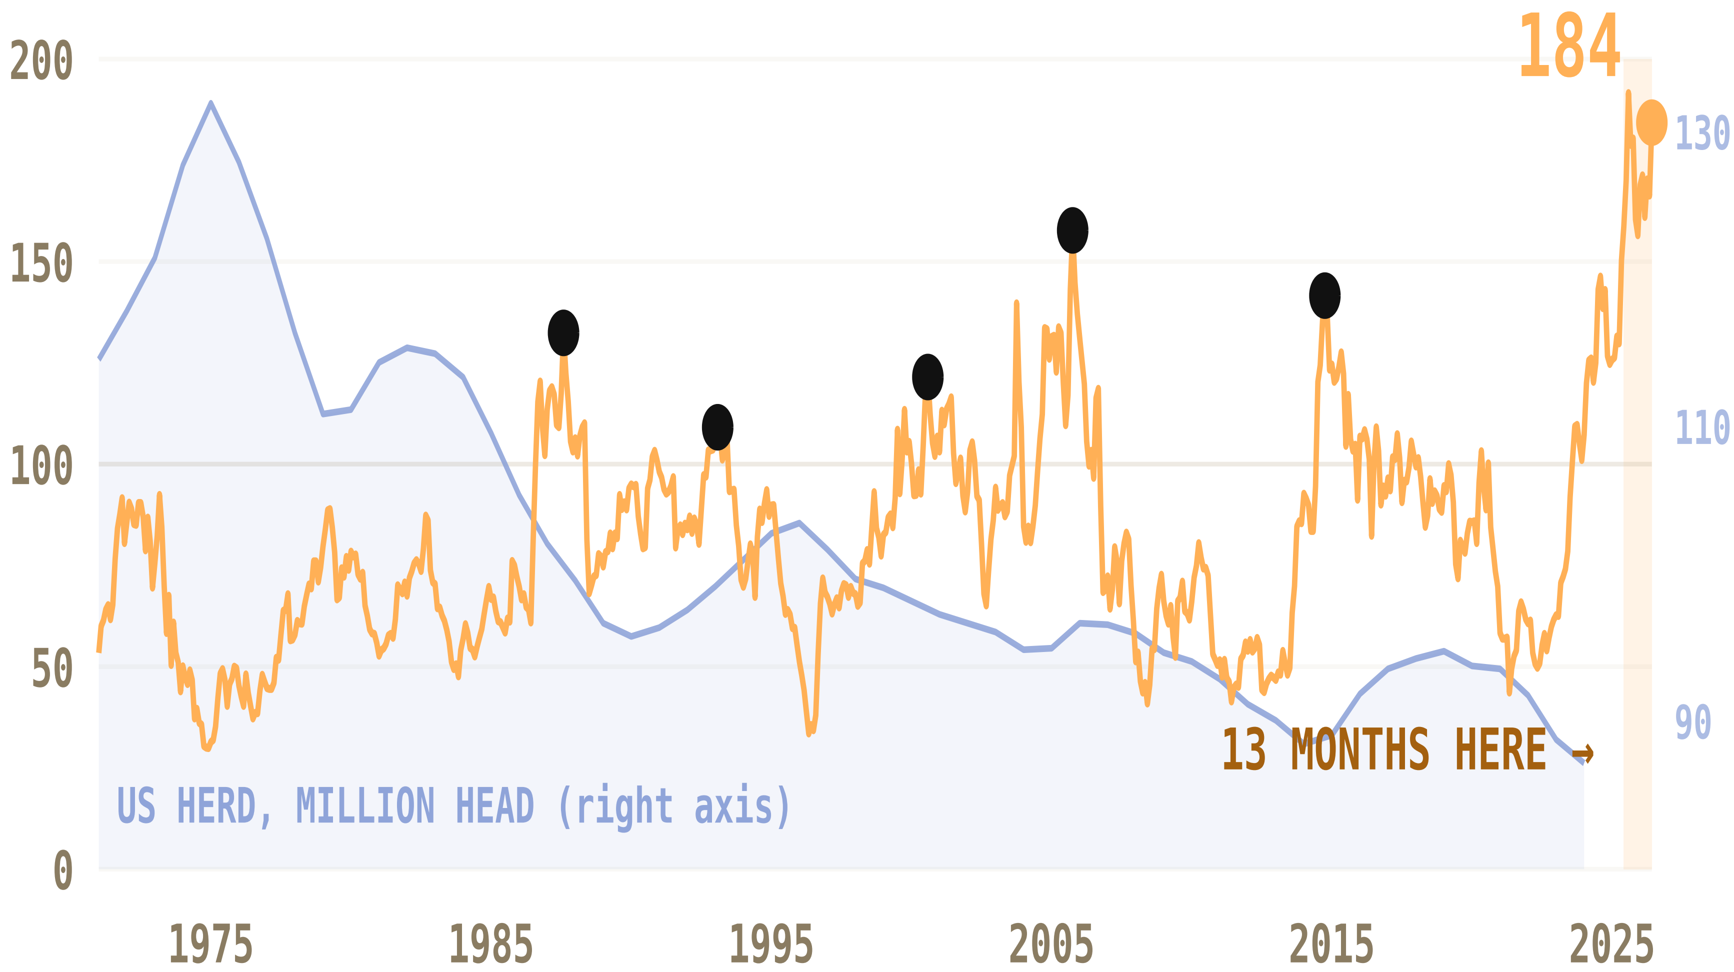
TR meat ÷ feed PPI
TurkStat · 2010→ · 198 mo

Not the same basket in each country — which is why each series is indexed to its own base, and why we read shape rather than level.

2 · WHERE WE ARE · UNITED STATES

Record margins. Fewest cattle since the series began.

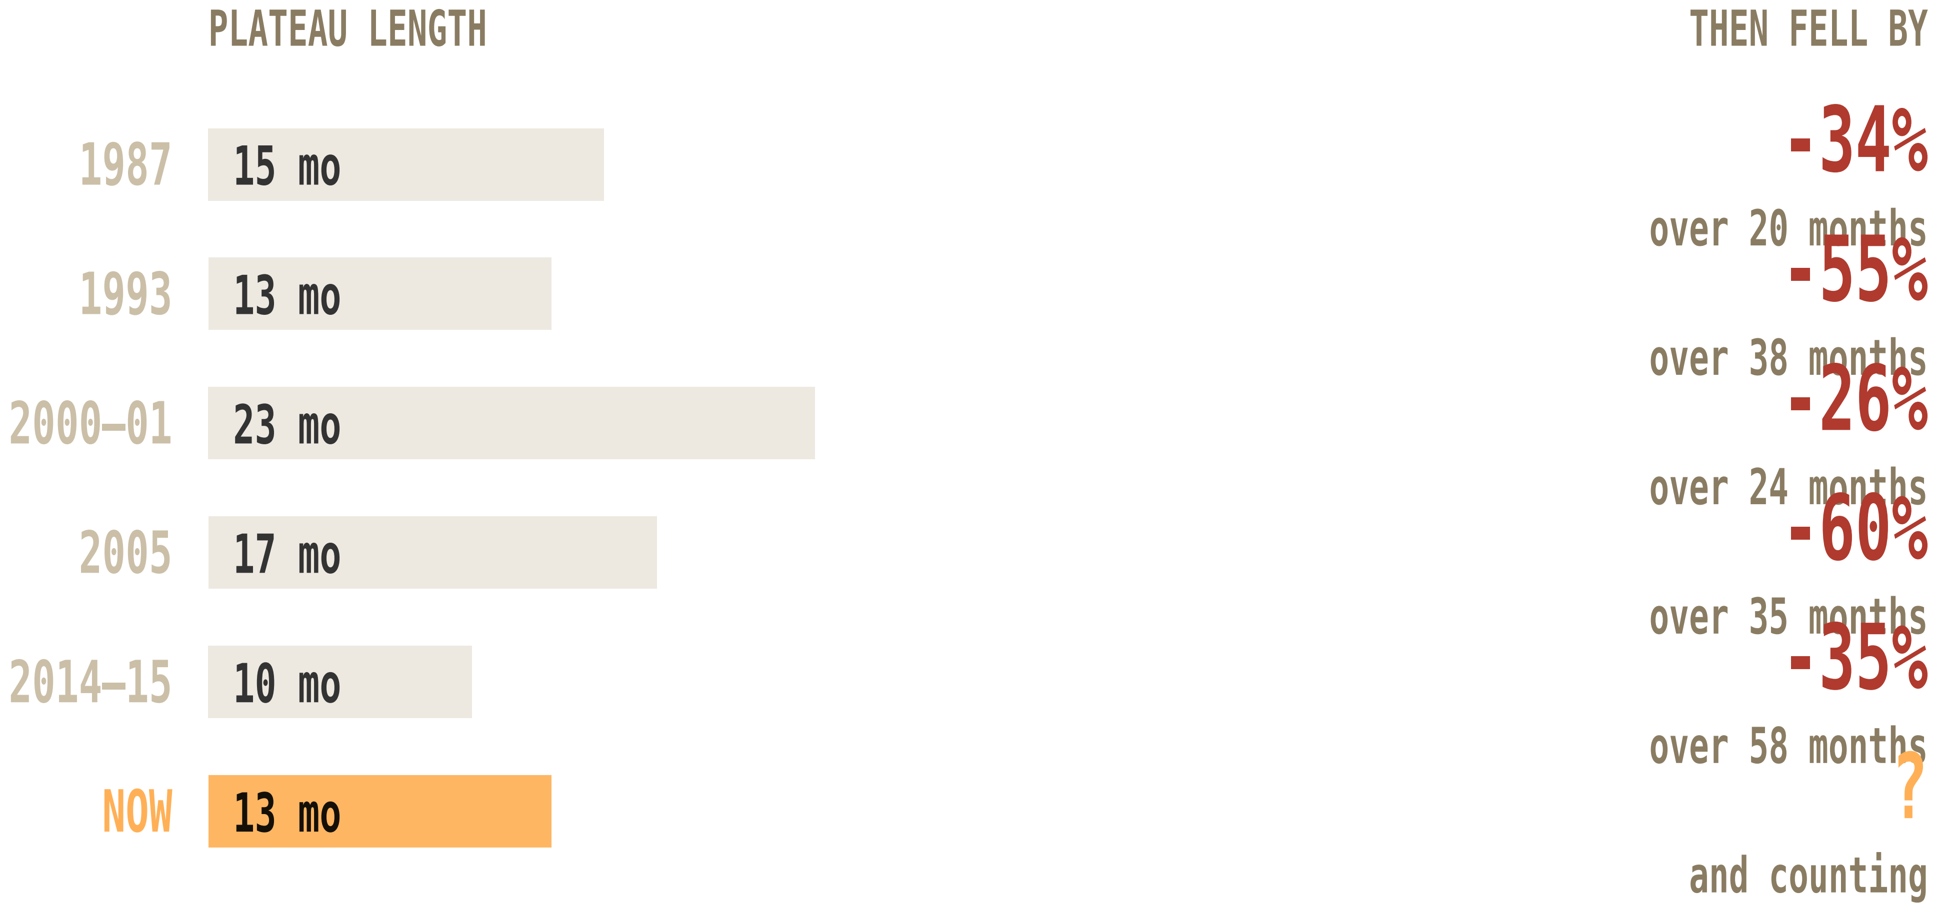
US only. Amber = producer margin ratio (left). Blue = the size of the US cattle herd (right). **Scarcity is what makes the margin.**



PARITY: MONTHLY, 2016 = 100 · HERD: FAOSTAT, ANNUAL · DOTS = PREVIOUS CYCLE PEAKS · 84% OF THE RATIO’S MOVEMENT COMES FROM FEED

Five US peaks. Every one fell 25–60% — over two to five years.

US cycles, 1971–2026 — the only record long enough to count them. Peaks and falls measured on the twelve-month average, so single-month spikes do not count as cycles.

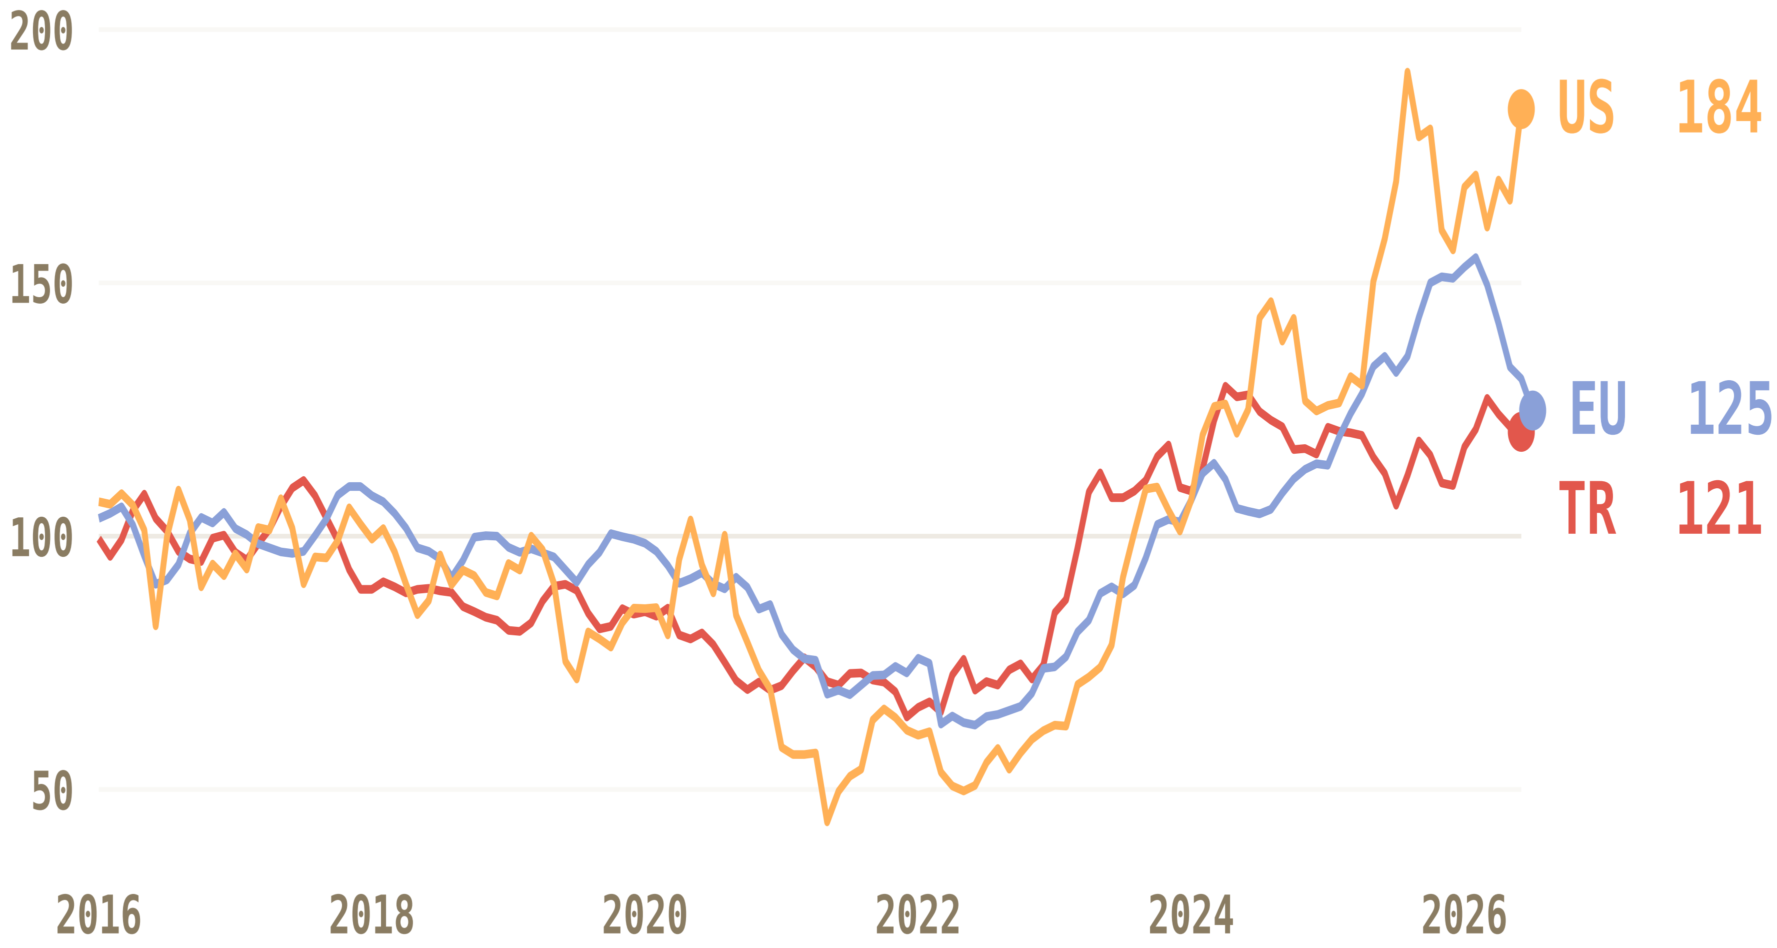


TWELVE-MONTH AVERAGE · PLATEAU = MONTHS WITHIN 10% OF PEAK · FALL = PEAK TO THE NEXT LOW · A CYCLE PEAK IS A LOCAL MAXIMUM OVER ±18 MONTHS

4 · WHO IS EXPOSED · ALL THREE MARKETS

Three markets. One cycle. At the same time.

Now all three — each on its own 2016 = 100 base. Watch the shape, not the gap: the level is not comparable, the timing is.

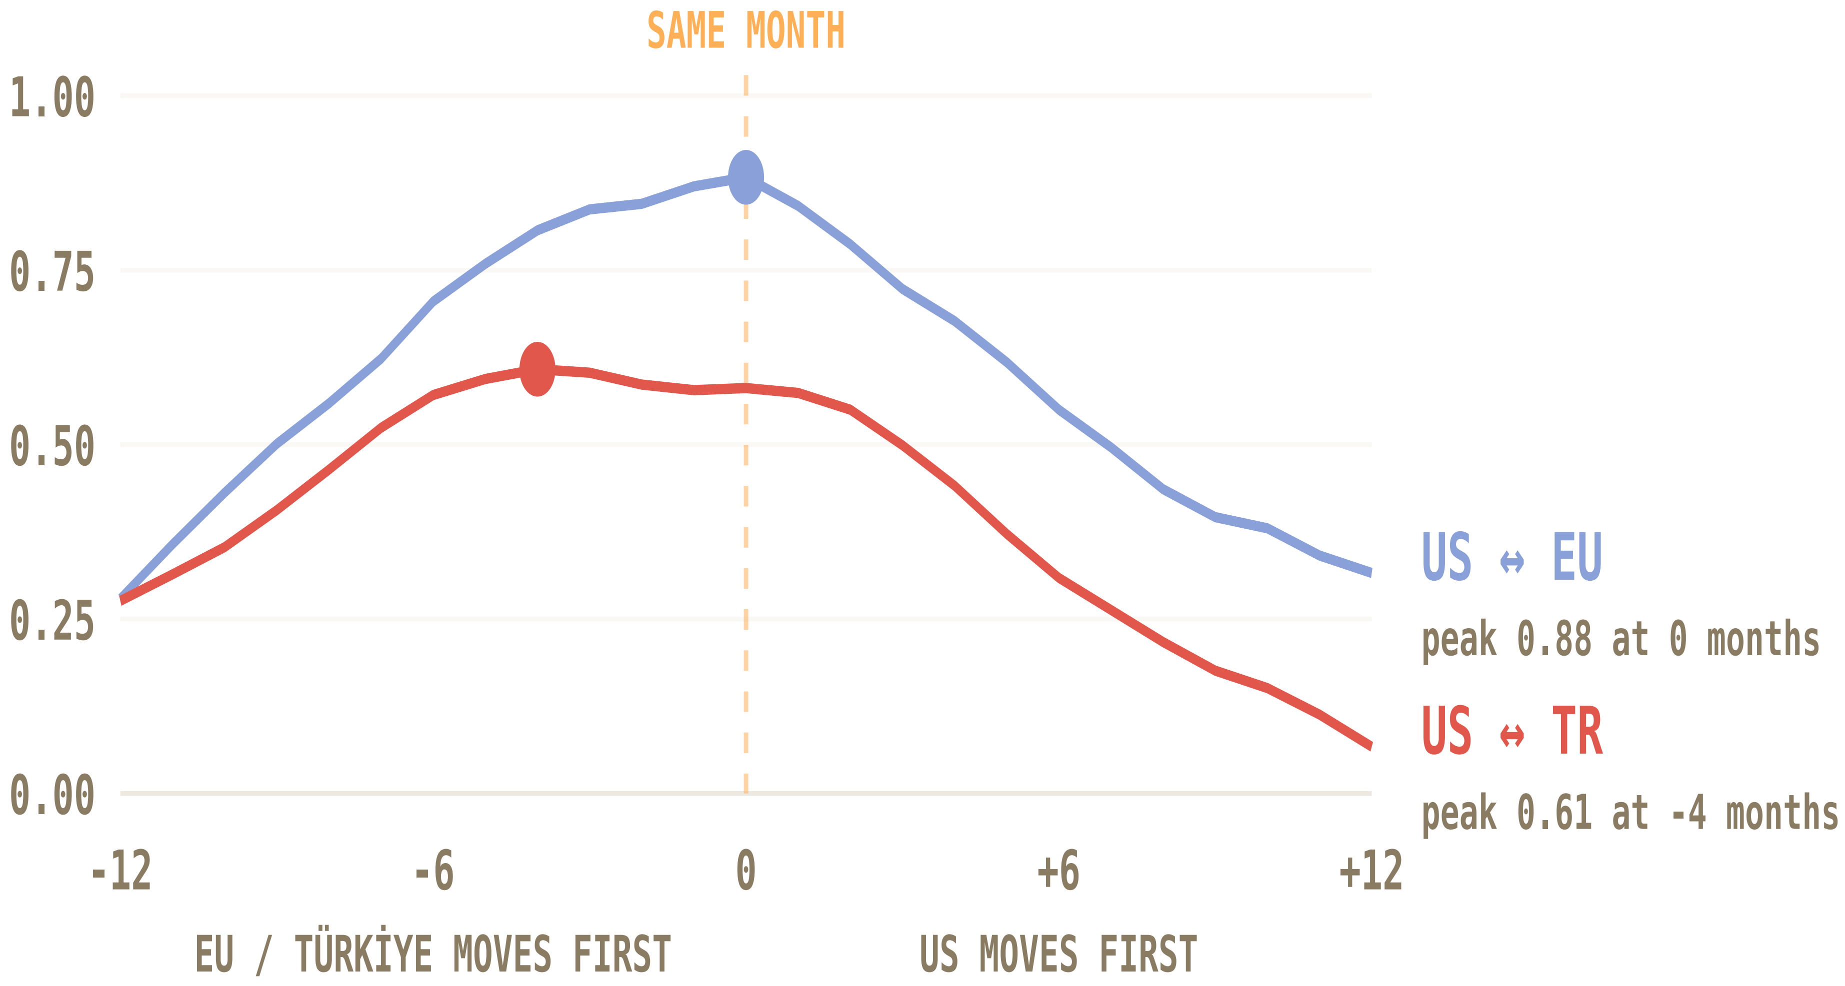


EACH MARKET INDEXED TO ITS OWN 2016 AVERAGE = 100 · US–EU CORRELATION 0.88 AT ZERO LAG

5 · ARE THEY REALLY THE SAME CYCLE?

Yes — and nobody goes first, so there is no early warning.

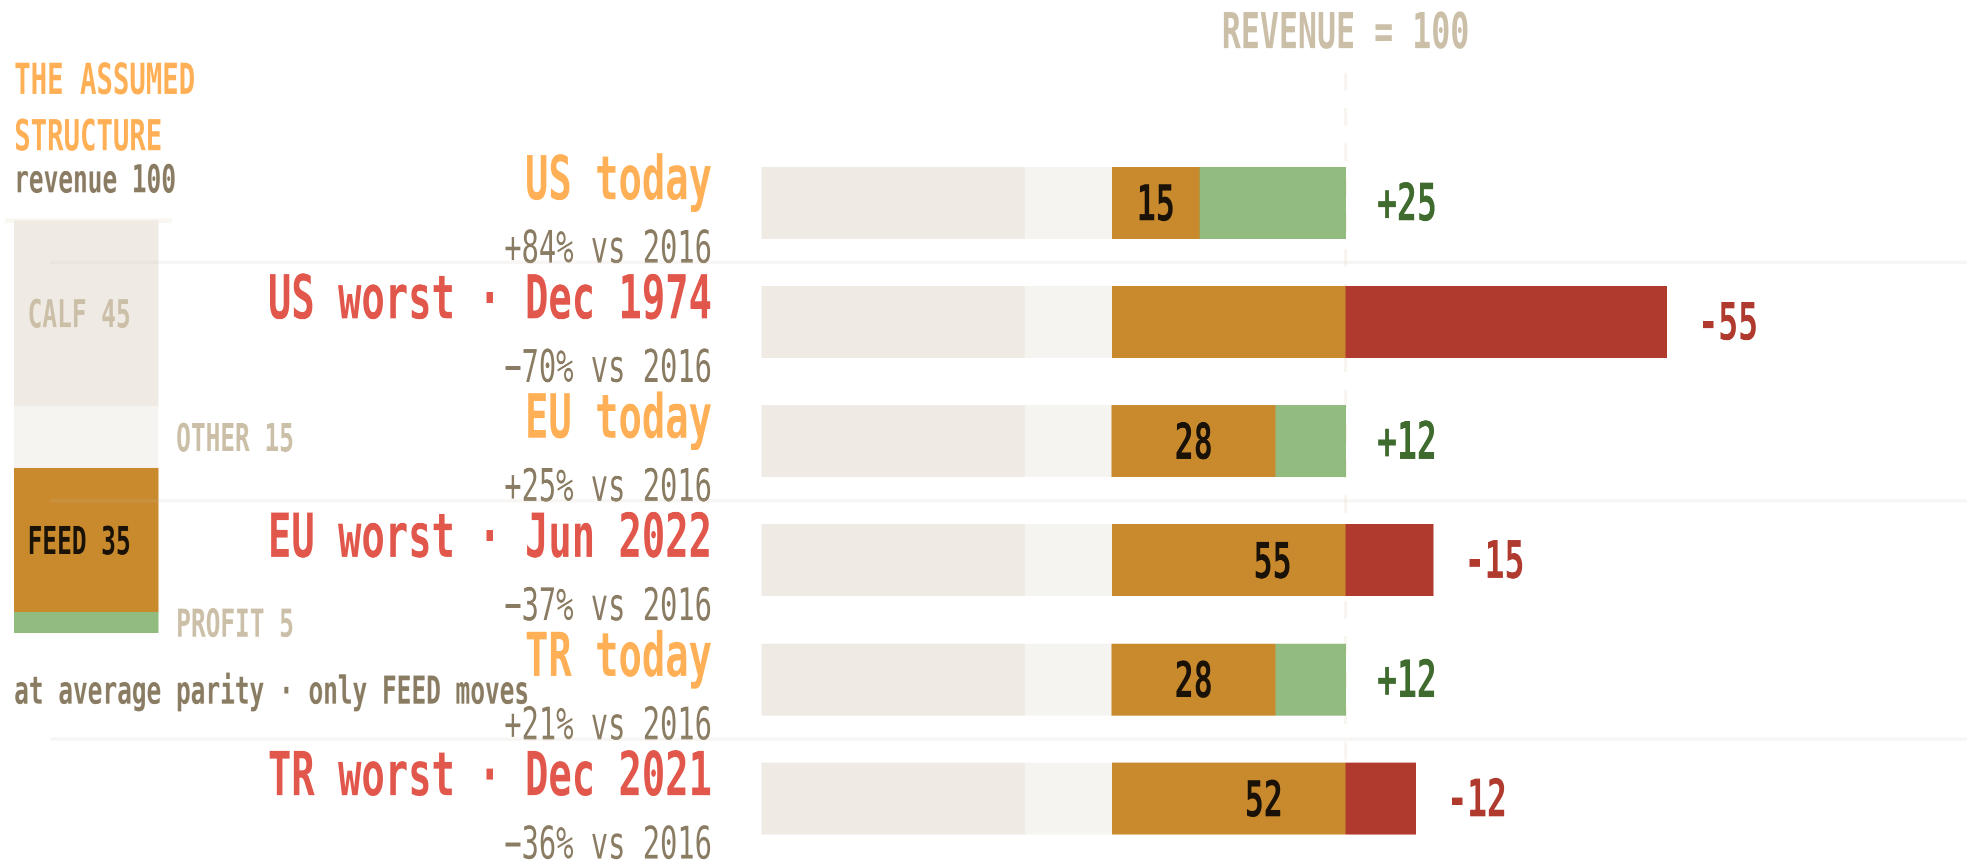
Correlation of year-on-year change, tested at every shift from −12 to +12 months. A market that led would peak clearly off-centre. The EU peaks exactly at zero; Türkiye is flat across −4 to 0.



IF ONE MARKET LED, WE COULD WATCH IT AND PREPARE THE OTHERS. IT DOES NOT. · PEARSON CORRELATION ON YEAR-ON-YEAR CHANGE · US–EU 116 OVERLAPPING MONTHS · US–TÜRKİYE 186

The same swing, in all three markets.

Costs per 100 of revenue — today vs each market's own worst month. One assumed cost structure, applied identically to all three markets.



The cost split is approximate — roughly a feedlot's shape, where the animal is the biggest cost and feed the next. It is held identical for all three markets on purpose, so only the ratio moves. Read the swing, not the level: US calf prices are at a record today, so the real US margin is thinner than shown.

REVENUE INDEXED TO 100 · WORST MONTH = WITHIN EACH MARKET'S OWN RECORD · US 1971→ · EU 2015→ · TR 2010→

7 · SO WHAT — AND WHAT I AM ASKING FOR

The link we have not proven yet.

This shows the cycle in our customers' economics. **It does not yet show what they do about it — that is the gap, and it is the work.**

1

What we know

Producer margins are at a cycle peak in all three markets. Five for five, every previous US peak reversed — by 25 to 60%, over two to five years.

2

What we do not know

Whether animal-health spend moves with this ratio at all, and if so what gets cut first. **Nothing in this deck evidences that link.** It is the assumption the commercial case rests on, and it is testable.

3

The ask

Two to three weeks with the livestock commercial teams: map our sales through the last two downturns against this ratio, and rank the portfolio by what a producer defers first. **What I need from you is an introduction to the livestock lead.** The macro side is already done.
