

Two molecules. Opposite outcomes.

Two molecules defined the decade in metabolic medicine. The market rewarded them very differently.

Share price total return of each molecule's maker, Jan 2021 - Jul 2026.

PERFORMANCE SINCE 2015

A decade apart.

+1,852%

tirzepatide

dual GIP/GLP-1 agonist · share return, Eli Lilly

+175%

semaglutide

GLP-1 receptor agonist · share return, Novo Nordisk

S&P 500

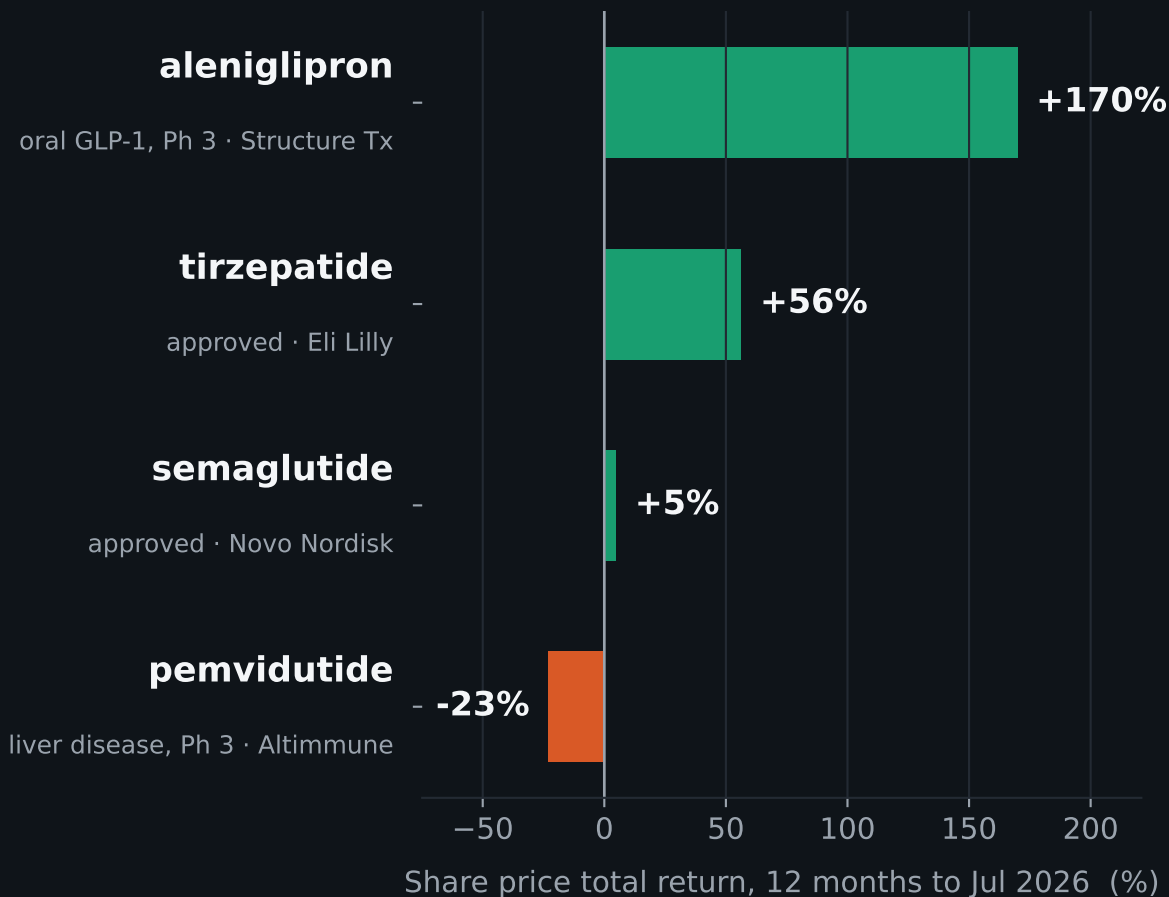

market benchmark

+275%

The molecule that created the category did not produce the larger return.

Total return, Jan 2015 – Jul 2026

Results varied widely.

The highest and lowest performers are both pre-revenue. Their share prices move on trial results, not on sales.

Returns are company share prices, grouped by lead molecule. Selection: best and worst of the ten, plus the two approved molecules. The broad biotech index rose +72% over the same period; it is not GLP-1 specific.

THE MAIN FINDING

Returns came from one company.

All six GLP-1 companies
equally weighted

+450%

S&P 500
market benchmark

+275%

Excluding tirzepatide's maker
the other five, equally weighted

+170%

Exposure to the drug class was not enough.

Excluding a single company, the group returned less than the index over the same period.

Held from Jan 2015 to Jul 2026. Total return.

VALUATION

A lower multiple reflects lower expected growth.

	semaglutide Novo Nordisk	tirzepatide Eli Lilly
Price ÷ earnings	14.1x	39.6x
Expected growth, 5-yr	+7%	+17%
PEG (multiple ÷ growth)	2.26	1.92

A lower PEG indicates better value for the growth expected.

Adjusted for growth, Novo Nordisk is the more expensive of the two.

These are the only two GLP-1 molecules approved for obesity. The comparison is the whole market.

Multiples are company-level, not molecule-level. Trailing figures use reported earnings; consensus growth is on an adjusted basis. Snapshot, not live.

What this does not cover.

These figures show what the market currently expects. They do not forecast trial outcomes, regulatory decisions or pricing.

Returns and multiples are company-level. A molecule names a programme, not the source of a company's return.

Valuation data is a point-in-time snapshot.
