

Three markets, 993 months, one ratio.

Six published price series, consolidated into a single comparable measure of what a livestock producer earns — then read for its cycle.

Our customers are at their most profitable point in 55 years.

184

US meat-to-feed parity today
(2016 average = 100)

13

months already spent

that held

WHAT YOU ARE LOOKING AT

One ratio: what a kilo of meat buys in feed.

THE MEASURE

PARITY =

meat price ÷ feed cost

Higher = meat outpacing feed → the producer earns more.

Lower = feed eating the margin.

THE SCALE

Each market is indexed to **its own 2016 average = 100.**

So 184 means US producers earn 84% more per kilo of feed than they did in 2016. The three lines are comparable in shape, not in level.

WHICH PRICES, EXACTLY

US slaughter cattle ÷ corn

BLS producer prices · 1971 → · 666 months

EU beef reference price ÷ compound feed

Eurostat · 2015 → · 129 months

TR meat ÷ feed producer prices

TurkStat · 2010 → · 198 months

Not the same basket in each country — which is exactly why each series is indexed to its own base, and why we read shape rather than level.

The US: a record — and it has stopped climbing.

US only — the one market with a 55-year record. Line = producer margin ratio, one point per month; higher is better for the producer.

Five US peaks. Every one fell 25–60%.

US cycles, 1971–2026 — the only record long enough to count them. Bar = how long each peak lasted; right = how far the ratio then fell.

Three markets. One cycle. At the same time.

Now all three — each on its own 2016 = 100 base. Watch the shape, not the gap: the level is not comparable, the timing is.

EACH MARKET INDEXED TO ITS OWN 2016 AVERAGE = 100 • US-EU CORRELATION 0.88 AT ZERO LAG

5 · ARE THEY REALLY THE SAME CYCLE?

Yes — and nobody goes first.

Correlation of year-on-year change, tested at every shift from -12 to +12 months. A market that led would peak clearly off-centre. The EU peaks exactly at zero; Türkiye is flat across -4 to 0.

The same swing, in all three markets.

Costs per 100 of revenue — today vs each market's own worst month. Same cost structure everywhere, so the swing is comparable.

ILLUSTRATIVE MODEL · FEED = 35 × (MARKET'S MEAN PARITY ÷ THAT MONTH'S PARITY) · WORST MONTH = WITHIN EACH MARKET'S OWN RECORD

We don't know what they cut first.

1 The window is now

Customers have cash today. The conversation is easier while they are profitable.

2 Phasing beats size

A price move landing into a downturn behaves differently from one landing into a peak.

3 Next step: two to three weeks

Map what producers actually cut, in what order, in the last two downturns — against our portfolio.
The macro side is done.
