

Three markets, 993 months, one ratio.

Six published price series, consolidated into a single comparable measure of what a livestock producer earns — then read for its cycle.

Cattle producers in all three of our markets are at a cycle peak.

184_{US} **125**_{EU} **121**_{TR}

meat-to-feed parity today — each market against its own 2016 average

13

months the US has already spent at this peak

0

of the five previous US peaks that held

WHAT YOU ARE LOOKING AT

One ratio: what a kilo of beef buys in feed.

Higher = meat outpacing feed, the producer earns more. Lower = feed eating the margin.

ONE KILO OF US BEEF BUYS... (UNITED STATES ONLY)

each oval = 0.5 kg of feed · US meat and corn producer prices

ALL THREE MARKETS · EACH VS ITS OWN 2016

US 184 = 84% more feed per kilo of beef than in 2016.

Levels differ by market – read the shape, not the gap.

US slaughter cattle ÷ corn

BLS (US federal statistics office) · 1971→ · 666 mo

EU beef ref. price ÷ compound feed

Eurostat · 2015→ · 129 mo

TR meat ÷ feed PPI

TurkStat · 2010→ · 198 mo

Not the same basket in each country — which is why each series is indexed to its own base, and why we read shape rather than level.

The US: a record — and it has stopped climbing.

US only — the one market with a 55-year record. Line = producer margin ratio, one point per month; higher is better for the producer.

Five US peaks. Every one fell 25–60%.

US cycles, 1971–2026 — the only record long enough to count them. Bar = how long each peak lasted; right = how far the ratio then fell.

Three markets. One cycle. At the same time.

Now all three — each on its own 2016 = 100 base. Watch the shape, not the gap: the level is not comparable, the timing is.

EACH MARKET INDEXED TO ITS OWN 2016 AVERAGE = 100 • US-EU CORRELATION 0.88 AT ZERO LAG

5 · ARE THEY REALLY THE SAME CYCLE?

Yes — and nobody goes first.

Correlation of year-on-year change, tested at every shift from -12 to +12 months. A market that led would peak clearly off-centre. The EU peaks exactly at zero; Türkiye is flat across -4 to 0.

The same swing, in all three markets.

Costs per 100 of revenue — today vs each market's own worst month. One assumed cost structure, applied identically to all three markets.

These are modelled levels, not measured margins. Calf 45 and other costs 15 are assumed and held fixed for every market; only feed moves, at $35 \times (\text{that market's mean parity} \div \text{that month's parity})$. US calf prices are at a record today, so the real US margin is thinner than shown. **What the data supports is the size of the swing, not the absolute level.**

We don't know what they cut first.

1 The window is now

Customers have cash today. The conversation is easier while they are profitable.

2 Phasing beats size

A price move landing into a downturn behaves differently from one landing into a peak.

3 Next step: two to three weeks

Map what producers actually cut, in what order, in the last two downturns — against our portfolio.
The macro side is done.
