

Three markets, 993 months, one ratio.

Six published price series, consolidated into a single comparable measure of what a livestock producer earns — then read for its cycle.

Cattle producers in all three of our markets are at a cycle peak.

+84%_{US} **+25%**_{EU} **+21%**_{TR}

more feed a kilo of beef buys today than it did in 2016 — each market against its own past

13

months the US has already spent at this peak

0

of the five previous US peaks that held

WHAT YOU ARE LOOKING AT

One ratio: what a kilo of beef is worth in feed.

Higher = meat outpacing feed, the producer earns more. It is a relative measure — read it against its own past, never as a quantity of feed.

FEED-BUYING POWER OF A KILO OF US BEEF

Dec 1974 1 kg → ● ×1
the weakest month on record

Jun 2026 1 kg → ●●●●●● ×6.2
6.2 times stronger

ALL THREE MARKETS · EACH VS ITS OWN 2016

US 184 = 84% more feed per kilo of beef than in 2016.

each oval = the Dec 1974 low · ratio of US cattle and corn producer price index

US slaughter cattle ÷ corn

BLS (US federal statistics office) · 1971→ · 666 mo

EU beef ref. price ÷ compound feed

Eurostat · 2015→ · 129 mo

TR meat ÷ feed PPI

TurkStat · 2010→ · 198 mo

Not the same basket in each country — which is why each series is indexed to its own base, and why we read shape rather than level.

The US: a record — and it has stopped climbing.

US only — the one market with a 55-year record. Line = producer margin ratio, one point per month; higher is better for the producer.

US MEAT-TO-FEED PARITY, MONTHLY, 1971–2026 • 2016 = 100 • DOTS = PREVIOUS CYCLE PEAKS • 84% OF THE YEAR-ON-YEAR MOVEMENT COMES FROM THE FEED SIDE, 16% FROM CATTLE

Five US peaks. Every one fell 25–60%.

US cycles, 1971–2026 — the only record long enough to count them. Peaks and falls measured on the twelve-month average, so single-month spikes do not count as cycles.

TWELVE-MONTH AVERAGE · PLATEAU = MONTHS WITHIN 10% OF PEAK · FALL = PEAK TO THE NEXT LOW · A CYCLE PEAK IS A LOCAL MAXIMUM OVER ±18 MONTHS

Three markets. One cycle. At the same time.

Now all three — each on its own 2016 = 100 base. Watch the shape, not the gap: the level is not comparable, the timing is.

EACH MARKET INDEXED TO ITS OWN 2016 AVERAGE = 100 • US-EU CORRELATION 0.88 AT ZERO LAG

5 • ARE THEY REALLY THE SAME CYCLE?

Yes — and nobody goes first.

Correlation of year-on-year change, tested at every shift from -12 to +12 months. A market that led would peak clearly off-centre. The EU peaks exactly at zero; Türkiye is flat across -4 to 0.

The same swing, in all three markets.

Costs per 100 of revenue — today vs each market's own worst month. One assumed cost structure, applied identically to all three markets.

The cost split is approximate — roughly a feedlot's shape, where the animal is the biggest cost and feed the next. It is held identical for all three markets on purpose, so only the ratio moves. Read the swing, not the level: US calf prices are at a record today, so the real US margin is thinner than shown.

We don't know what they cut first.

1 The window is now

Customers have cash today. The conversation is easier while they are profitable.

2 Phasing beats size

A price move landing into a downturn behaves differently from one landing into a peak.

3 Next step: two to three weeks

Map what producers actually cut, in what order, in the last two downturns — against our portfolio.
The macro side is done.
